# Ferns and petals Sales Analysis Excel Dashboard

**Created by Deepak Gupta**

## 1. Project Overview

The FNP Sales Analysis Dashboard is a business intelligence project designed to analyze sales performance, revenue distribution, customer spending patterns, product performance, order volumes, and delivery efficiency. The dashboard provides a consolidated view of key business metrics, enabling stakeholders to monitor performance, identify revenue-generating products and occasions, and make data-driven decisions.

The project focuses on transforming sales and order data into meaningful visual insights through interactive charts, KPI cards, and date- and occasion-based filters. It helps management understand what is selling, where revenue is coming from, when orders generate the most revenue, and which areas may require operational improvement.

## 2. Business problem

Analyze FNP's 2023 sales data using an interactive Excel dashboard to identify revenue trends, customer spending patterns, top-performing products, and sales by city and gifting occasion. Evaluate monthly performance, order and delivery times, and the relationship between order quantity and delivery efficiency. The objective is to generate actionable insights to optimize sales strategy, inventory planning, and customer satisfaction.

## 3. Business Objectives

The primary objectives of this project are to:

- Monitor overall sales performance: Track total revenue, total orders, and average customer spending.
- Evaluate product performance: Identify the top five products contributing to revenue.
- Analyze monthly trends: Understand revenue fluctuations across the year and identify high- and low-performing months.
- Understand customer demand: Compare revenue across product categories, cities, and occasions.
- Analyze order timing: Examine revenue distribution by order hour to identify periods of stronger demand.
- Monitor delivery efficiency: Evaluate the average time taken to deliver orders.
- Support business decisions: Provide actionable insights for inventory planning, marketing campaigns, promotional activities, and delivery operations.

**4. Key Performance Indicators (KPIs)**

The dashboard highlights four major performance indicators.

Total Revenue

**₹35,20,984**

Overall revenue generated

Total Orders

**1,000**

Total orders recorded

Average Customer Spend

**₹3,521**

Average spending per order, approximately

Order-to-Delivery Time

**5.53**

Average delivery duration; unit to be confirmed

These KPIs provide a quick overview of the company's sales performance and operational efficiency. The average customer spending figure is approximately consistent with total revenue divided by 1,000 orders. The delivery-time unit should be verified against the original dataset before reporting it as days or hours.

**5. Dashboard Analysis and Key Findings**

**A. Monthly revenue analysis**

The monthly revenue chart shows noticeable fluctuations throughout the year.

- February records a strong revenue peak of approximately ₹7 lakh.
- August appears to be another high-performing month, with revenue exceeding ₹7 lakh.
- November also shows a notable increase compared with several surrounding months.
- Several other months record relatively lower revenue, suggesting seasonal variations in customer demand.

Business implication: The company can investigate the campaigns, occasions, product demand, and promotional activities associated with peak months. Marketing budgets and inventory levels can then be planned around historical demand patterns.

**B. Top five products by revenue**

The dashboard compares the revenue contribution of Deserunt Box, Dolores, Harum, Magnam, and Quia Gift.

- Magnam is the highest-revenue product among the five, at approximately ₹1.21 lakh.
- Quia Gift contributes approximately ₹1.13 lakh.
- Dolores generates approximately ₹1.06 lakh.
- Harum and Deserunt Box contribute approximately ₹1.01 lakh and ₹0.97 lakh, respectively.

Business implication: High-performing products can receive greater promotional attention, while lower-performing products can be investigated for pricing, demand, product positioning, and marketing effectiveness.

Note: These product labels appear unusual in the screenshot. Verify the original product names before publishing the findings.

**C. Revenue by product category**

The category chart highlights differences in revenue across seven product categories.

- Colors is the strongest category, generating approximately ₹10 lakh.
- Soft Toys and Sweets each contribute approximately ₹7.3 lakh.
- Cake generates approximately ₹3.3 lakh.
- Raksha Bandhan-related products contribute approximately ₹3 lakh.
- Plants and Mugs have comparatively lower revenue.

Business implication: The company should prioritize stock availability and marketing for high-revenue categories while examining whether lower-revenue categories have opportunities for cross-selling, better visibility, or targeted promotions.

**D. Top 10 cities by orders**

The city-level chart compares order volumes across Imphal, Kavali, Haridwar, Guntakal, Bhatpara, Bidhannagar, Bilaspur, Dhanbad, Dibrugarh, and North Dumdum.

- Imphal records approximately 29 orders.
- Dhanbad records approximately 28 orders.
- Kavali records approximately 27 orders.
- The remaining cities contribute comparatively similar, though varying, order volumes.

Business implication: Cities with higher order volumes may warrant closer monitoring of inventory availability and delivery capacity. However, order volume alone does not establish profitability; city-level revenue, delivery costs, and order values should also be compared.

**E. Revenue by order hour**

The hourly revenue trend fluctuates throughout the day.

- Revenue increases during several morning and afternoon hours.
- Stronger revenue levels appear during the evening, particularly around 18:00–20:00.
- The chart shows lower revenue around hour 10 and several other intervals.

Business implication: The company can use hourly demand patterns to plan customer support, order processing, staffing, and promotional campaigns. Further analysis should compare hourly order counts with revenue to determine whether peaks are driven by more orders or higher-value orders.

**F. Revenue by occasion**

The occasion chart shows that revenue differs considerably depending on the gifting occasion.

| Occasion | Approximate revenue |
|---|---|
| Anniversary | ₹6.75 lakh |
| Raksha Bandhan | ₹6.25 lakh |
| All Occasions | ₹5.8 lakh |
| Holi | ₹5.7 lakh |

| | |
|---|---|
| Birthday | ₹4.0 lakh |
| Valentine's Day | ₹3.3 lakh |
| Diwali | ₹3.1 lakh |

Business implication: Anniversary and Raksha Bandhan-related sales are major revenue contributors in the displayed data. The business can use occasion-specific promotions, gift bundles, personalized recommendations, and advance inventory planning to strengthen sales. Lower-performing occasions should be investigated before changing their marketing budgets.

**G. Delivery efficiency**

The dashboard reports an average order-to-delivery time of 5.53.

This KPI is useful for evaluating the customer fulfillment process, but the screenshot alone does not establish whether this duration is measured in hours or days.

Business implication: Management can compare delivery time by city, occasion, product category, and order volume to identify delays. Tracking the percentage of orders delivered on time and the longest delivery delays would provide a more complete view of service quality.

**6. Interactive Dashboard Features**

The dashboard includes several interactive elements that help users explore the data from different perspectives.

- Order Date filter: Allows users to examine sales across selected order periods.
- Delivery Date filter: Supports analysis of delivery-related periods.
- Occasion filter: Enables users to focus on particular occasions, such as Anniversary, Birthday, Diwali, Holi, and Raksha Bandhan.
- KPI cards: Summarize the most important business metrics.
- Charts and graphs: Present monthly trends, product revenue, category performance, hourly revenue, city-level orders, and occasion-based revenue.

These features enable users to move from a high-level business overview to more focused analysis without manually reviewing individual transactions.

**7. Business Recommendations**

Based on the patterns visible in the dashboard, the following actions are recommended.

1. Plan seasonal campaigns: Investigate February, August, and November sales peaks to identify successful campaigns and replicate effective strategies.
2. Prioritize high-performing categories: Maintain appropriate inventory for Colors, Soft Toys, and Sweets while exploring growth opportunities in other categories.
3. Strengthen occasion-based marketing: Develop targeted promotions for Anniversary and Raksha Bandhan, and evaluate the reasons behind lower revenue for some occasions.
4. Optimize delivery operations: Analyze delivery time by location and period, especially during high-demand seasons.
5. Improve city-level planning: Combine city order volumes with revenue and delivery costs before deciding where to allocate additional resources.
6. Investigate hourly trends: Use order counts and average order values alongside hourly revenue to optimize staffing and promotions.
7. Track additional KPIs: Consider profit margin, average order value, cancellation rate, repeat-customer rate, and on-time delivery percentage for a more comprehensive view of performance.

**8. Tools and Skills Demonstrated**

- **ETL:** Extracted, transformed, and prepared sales data for analysis.
- **Power Query:** Cleaned and transformed data by handling missing values, correcting data types, and standardizing formats.
- **Data Modeling:** Established relationships between orders, products, and customer tables.
- **Pivot Tables:** Summarized sales data to analyze revenue, product performance, and order trends.
- **DAX:** Created measures and calculated KPIs, including total revenue, average customer spending, total orders, and average delivery time.
- **Excel Dashboard:** Presented key metrics and business insights through interactive charts, visualizations, and date and occasion filters.

**9. Conclusion**

The FNP Sales Analysis Dashboard provides a consolidated overview of sales performance across products, categories, cities, occasions, order hours, and delivery operations. With total revenue of approximately ₹35.21 lakh across 1,000 orders, the dashboard enables stakeholders to identify major revenue contributors and recognize potential seasonal and operational patterns.

The analysis suggests that Colors is the leading product category, Magnam is the top product among the five displayed, and Anniversary and Raksha Bandhan are prominent occasion-based revenue contributors. These findings can support more informed decisions about inventory planning, marketing allocation, and customer fulfillment.

Overall, this project demonstrates the practical application of data analysis and visualization to convert transactional data into actionable business insights.
